SaliPen

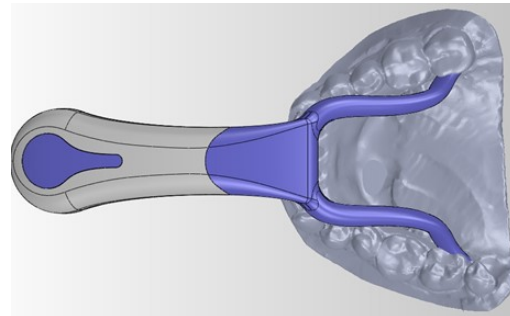

THE HIGH-TECH MOUTH MOISTENER

Relief of oral dryness

Dry mouth (or xerostomia), a condition affecting hundreds of million people worldwide, is a chronic and mostly irreversible condition induced, mainly, as a side effect of hundreds of commonly used medications, by radiation therapy for head & neck cancer, and by auto-immune diseases.

Dry mouth harms significantly the patient's quality of life, causes difficulties in chewing, swallowing and speaking, causes bad breath and sleep disturbance, and exposes the teeth to high rate of decay.

Currently, dry mouth is treated either by medications, mouthwashes or gels.

SaliPen is an innovative device that treats dry mouth by electro-stimulation that increases the production of saliva and is not felt by the patient. Its two flexible arms, with the stimulating electrodes at the tip of each arm, are placed in the mouth, underneath the tongue.

SaliPen advantages are:

- Long-lasting wetness effect
- Increasing the production of natural saliva
- Useful for all dry mouth patients
- No side effects
- Low cost

Worldwide clinical trials demonstrated significant improvement in oral wetness.

The technology is backed-up by numerous scientific publications.
